COMP 6461

Computer Networks & Protocols

Winter 2023
Dr. Abdelhak Bentaleb

Lecture 1a

Introduction to Networking (Part 1)

Chapter 1: introduction

Overview/roadmap:

- What is the Internet?
- What is a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, internet structure
- Performance: loss, delay, throughput
- Protocol layers, service models, security

Chapter 1: introduction

After this chapter, you are expected to:

- Understand the basic terms, including host, packet, protocol, throughput, store-and-forward, and autonomous system.
- know about the logical (five protocol layers) and physical (a network of autonomous systems) architecture of the Internet.
- Understand the different components of end-to-end delay and their relations to bandwidth, packet size, distance, propagation speed, and queue size.
- Understand service model and introduction to network security.

Chapter 1: roadmap

- What is the Internet?
- What is a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, internet structure
- Performance: loss, delay, throughput
- Protocol layers, service models, security

The Internet: a "nuts and bolts" view

Billions of connected computing *devices*:

- hosts = end systems
- running network apps at Internet's "edge"

Packet switches: forward packets (chunks of data)

routers, switches

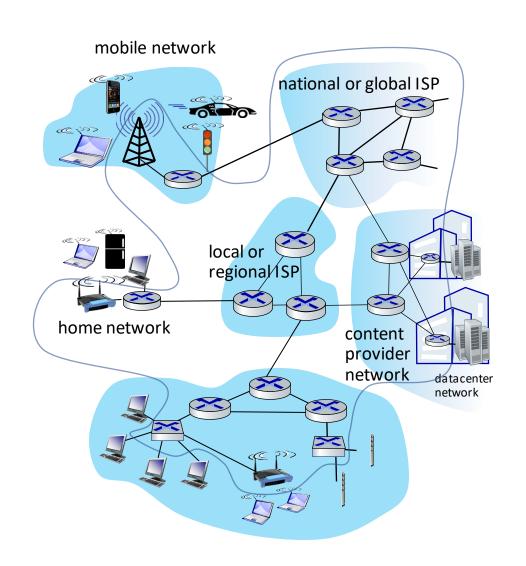

Communication links

- fiber, copper, radio, satellite
- transmission rate: bandwidth

Networks

 collection of devices, routers, links: managed by an organization

"Fun" Internet-connected devices

Pacemaker & Monitor

bikes

scooters

Internet phones

Gaming devices

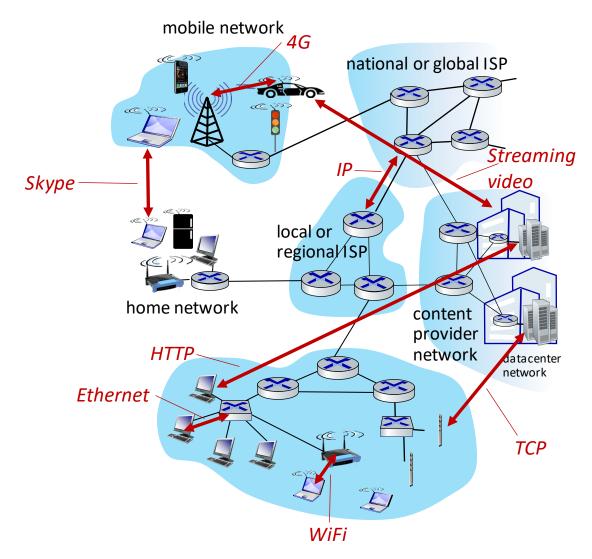

Others?

The Internet: a "nuts and bolts" view

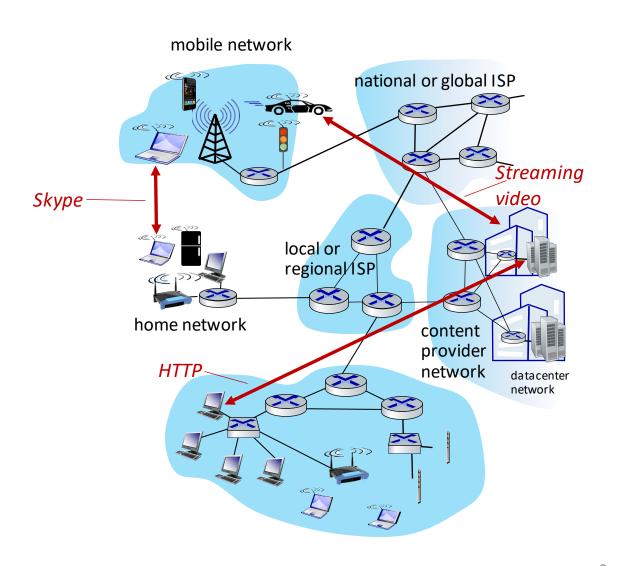

- Internet: "network of networks"
 - Interconnected ISPs
- protocols are everywhere
 - control sending, receiving of messages
 - e.g., HTTP (Web), streaming video, Skype, TCP, IP, WiFi, 4G, Ethernet

- Internet standards
 - RFC: Request for Comments
 - IETF: Internet Engineering Task
 Force

The Internet: a "services" view

- *Infrastructure* that provides services to applications:
 - Web, streaming video, multimedia teleconferencing, email, games, ecommerce, social media, interconnected appliances, ...
- provides programming interface to distributed applications:
 - "hooks" allowing sending/receiving apps to "connect" to, use Internet transport service
 - provides service options, analogous to postal service

What's a protocol?

Human protocols:

- "what's the time?"
- "I have a question"
- introductions

Rules for:

- ... specific messages sent
- ... specific actions taken when message received, or other events

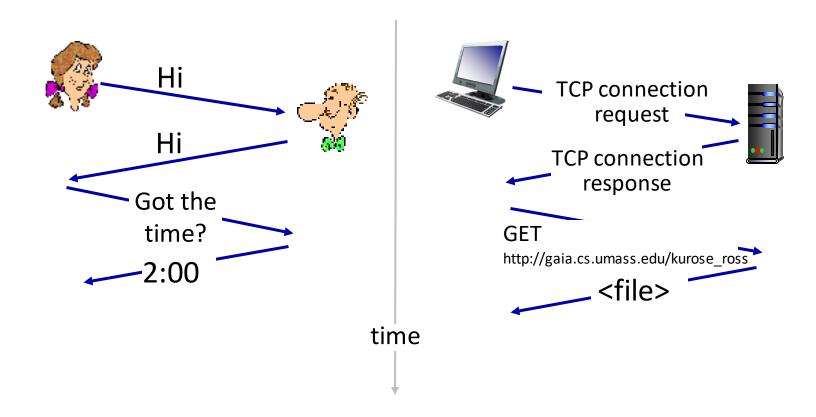

Network protocols:

- computers (devices) rather than humans
- all communication activity in Internet governed by protocols

Protocols define the format, order of messages sent and received among network entities, and actions taken on message transmission, receipt

What's a protocol?

A human protocol and a computer network protocol:

Q: other human protocols?

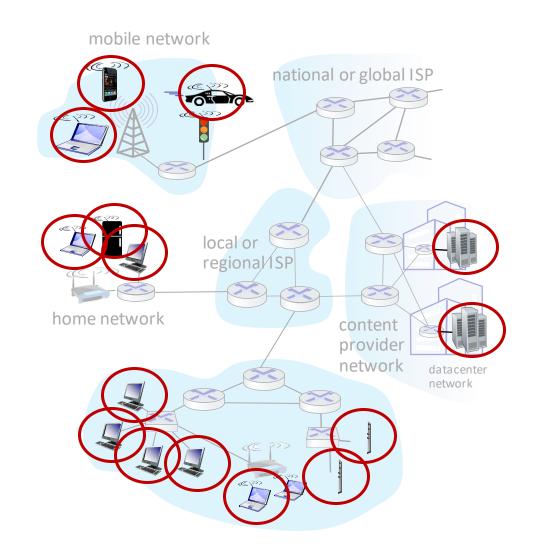

Chapter 1: roadmap

- What is the Internet?
- What is a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, internet structure
- Performance: loss, delay, throughput
- Protocol layers, service models

A closer look at Internet structure

Network edge:

- hosts: clients and servers
- servers often in data centers

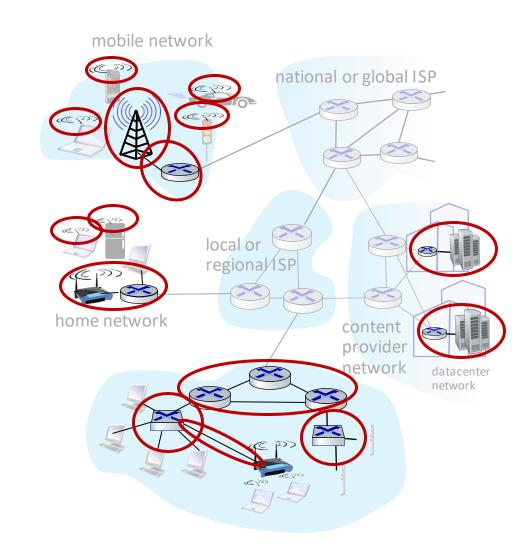

A closer look at Internet structure

Network edge:

- hosts: clients and servers
- servers often in data centers

Access networks, physical media:

wired, wireless communication links

A closer look at Internet structure

Network edge:

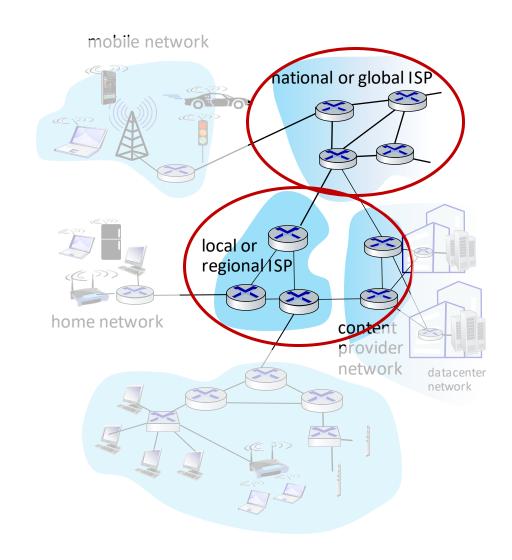

- hosts: clients and servers
- servers often in data centers

Access networks, physical media:

wired, wireless communication links

Network core:

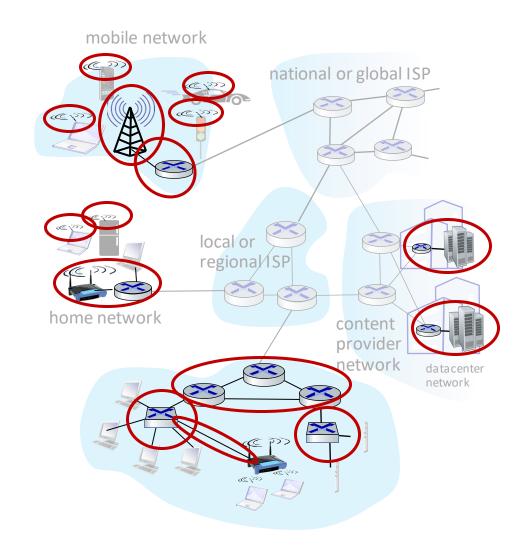

- interconnected routers
- network of networks

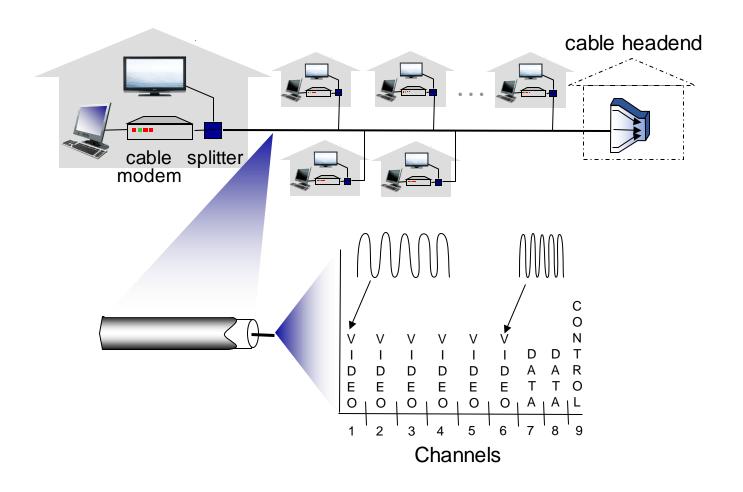

Access networks and physical media

Q: How to connect end systems to edge router?

- residential access nets
- institutional access networks (school, company)
- mobile access networks (WiFi, 4G/5G)

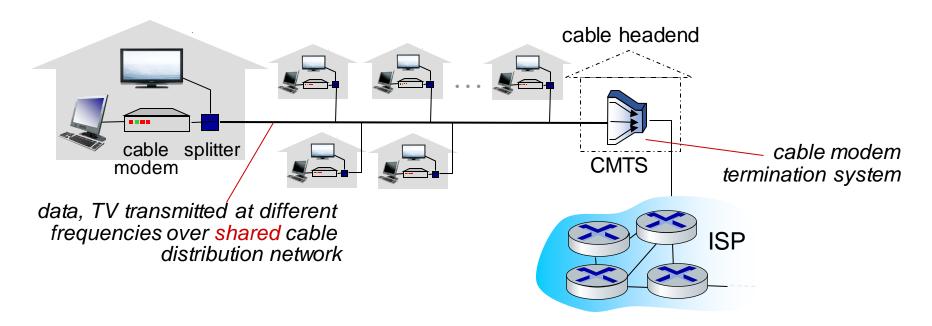

Access networks: cable-based access

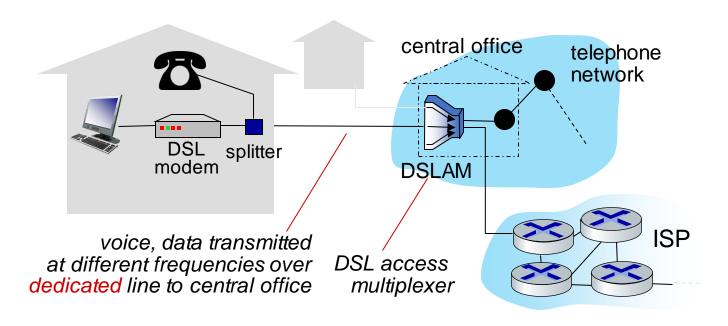

frequency division multiplexing (FDM): different channels transmitted in different frequency bands

Access networks: cable-based access

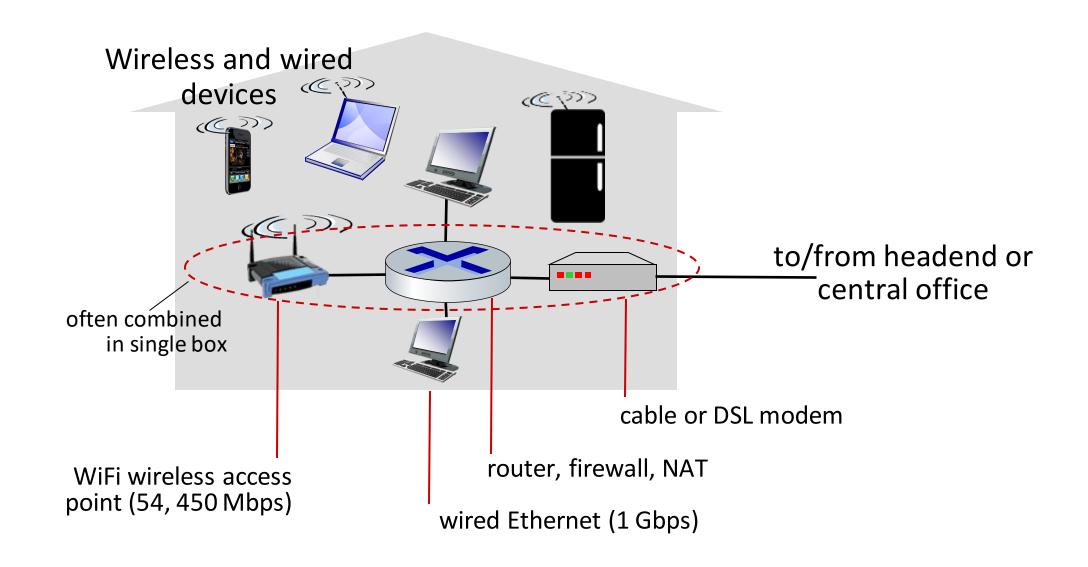

- HFC: hybrid fiber coax
 - asymmetric: up to 30Mbps downstream transmission rate, 2
 Mbps upstream transmission rate
- network of cable, fiber attaches homes to ISP router
 - homes share access network to cable headend
 - unlike DSL, which has dedicated access to central office

Access networks: digital subscriber line (DSL)

- use existing telephone line to central office DSLAM
 - data over DSL phone line goes to Internet
 - voice over DSL phone line goes to telephone net
- 24-52 Mbps dedicated downstream transmission rate
- 3.5-16 Mbps dedicated upstream transmission rate

Access networks: home networks

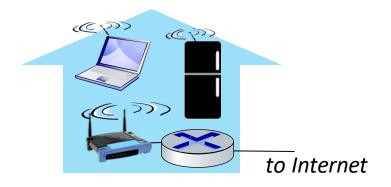

Wireless access networks

Shared wireless access network connects end system to router

via base station aka "access point"

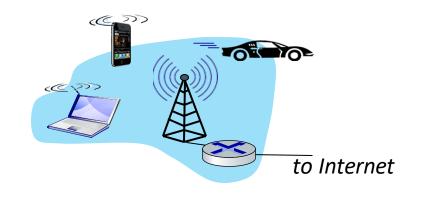

Wireless local area networks (WLANs)

- typically within or around building (~100 ft)
- 802.11b/g/n (WiFi): 11, 54, 450
 Mbps transmission rate

Wide-area cellular access networks

- Provided by mobile, cellular operators (10's km coverage)
- 10's Mbps transmission rate per-user
- 4G cellular network (5G is coming)

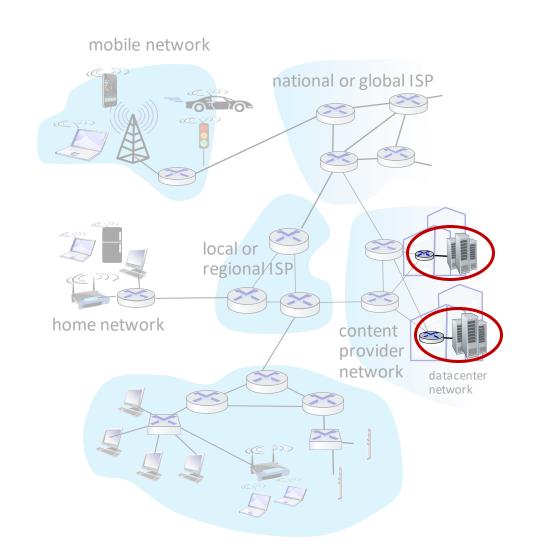

Access networks: data center networks

 high-bandwidth links (10s to 100s
 Gbps) connect hundreds to thousands of servers together, and to Internet

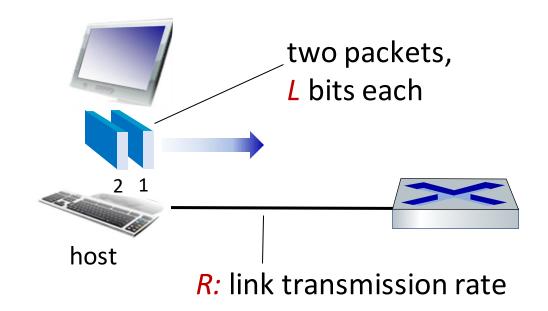

Courtesy: Massachusetts Green High Performance Computing Center (mghpcc.org)

Host: sends *packets* of data

host sending function:

- takes application message
- breaks into smaller chunks,
 known as packets, of length L bits
- transmits packet into access network at transmission rate R
 - link transmission rate, aka link capacity, aka link bandwidth

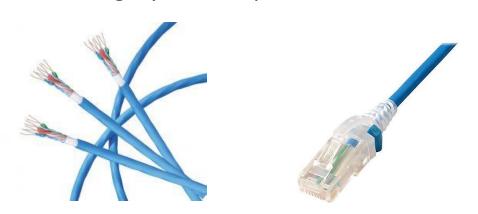

packet time needed to transmission = transmit
$$L$$
-bit = $\frac{L}{R}$ (bits/sec)

Links: physical media

- bit: propagates between transmitter/receiver pairs
- physical link: what lies between transmitter & receiver
- guided media:
 - signals propagate in solid media: copper, fiber, coax
- unguided media:
 - signals propagate freely, e.g., radio

Twisted pair (TP)

- two insulated copper wires
 - Category 5: 100 Mbps, 1 Gbps Ethernet
 - Category 6: 10Gbps Ethernet

Links: physical media

Coaxial cable:

- two concentric copper conductors
- bidirectional
- broadband:
 - multiple frequency channels on cable
 - 100's Mbps per channel

Fiber optic cable:

- glass fiber carrying light pulses, each pulse a bit
- high-speed operation:
 - high-speed point-to-point transmission (10's-100's Gbps)
- low error rate:
 - repeaters spaced far apart
 - immune to electromagnetic noise

Links: physical media

Wireless radio

- signal carried in various "bands" in electromagnetic spectrum
- no physical "wire"
- broadcast, "half-duplex" (sender to receiver)
- propagation environment effects:
 - reflection
 - obstruction by objects
 - Interference/noise

Radio link types:

- Wireless LAN (WiFi)
 - 10-100's Mbps; 10's of meters
- wide-area (e.g., 4G cellular)
 - 10's Mbps over ~10 Km
- Bluetooth: cable replacement
 - short distances, limited rates
- terrestrial microwave
 - point-to-point; 45 Mbps channels
- satellite
 - up to 45 Mbps per channel
 - 270 msec end-end delay
